By Major A. H. Thiessen
Science Service Meteorologist

Light has a punch! Who would suspect that the beneficent light of day has a kick? Light shining on an object really gives it a push. This effect is not, of course, visible to the naked eye, but it is there nevertheless. Light from the sun causes a real impact on the object it hits, exactly like a stream of water or a gust of wind. The interesting consequence of this is that any radiating body, as the sun or a warm stove, actually loses weight; for giving up energy means giving up weight. The sun, therefore, is losing weight at a rate 650 times as fast as the weight of water falling at Niagara.
