Wind tides on the Thames! Recently a news item was received that the Thames River, England, was flooding parts of London due to wind tides. Such tides are mentioned several times by the old chroniclers. One of them 650 years ago related that "the quays of the River Thames, which usually withstood the force of the sea, were overflowed, and the houses of the citizens were covered at a much greater distance than any mortal at any time has seen; villages, also fields, in several neighbouring parts were swallowed up and countless men and innumerable cattle in like manner were drowned."
