Science Service Meteorologist

Weather philosophy! It is pleasant to hear one say: "What a fine rain!" or, "What a magnificent storm!" How obvious it is that we must have weather changes, and yet we complain when the changes come. Our very lives depend upon weather changes. From the warmth and light so necessary to plant life, we must turn to snow and rain and be grateful for them. Winds also enter into the economy of nature. It furnishes power to sailing craft and to windmills, scatters the pollen of plants, and gives to all animal life that necessary and exhilarating ventilation which makes the heat bearable. Changes in the weather are also more stimulating than a monotonous condition, be it storm or calm.
