

For Release By Major A. H. Thiessen
April 6, 1938 Science Service Meteorologist

Coming of spring! In this or any other large country there is no single date for spring's advent. If spring's coming is defined as the time when dormant plant-life responds to the growing warmth, then in the South and on the Pacific Coast, where there is some growth all the year round, there is no spring. Thus spring advances from the south and west. Also, in mountainous regions, it advances upwards. The rate is about 17 miles a day eastward and northward, and about 100 feet a day upward. So if you have a mountain home do not expect the same weather as you have lower down except later and at the rate given.
