By Major A. H. Thiessen  
Science Service Meteorologist

Fashions in rainfall! Rainfall follows, in the several parts of this country, certain fashions or types. East of the Rockies we have what is known as the summer maximum type. In this type the greater part of the rainfall occurs in the warmer months. This feature is very pronounced in Florida, less so in New England and in Ohio. The other great type is called the Pacific; in it the greater portion of the rainfall occurs during the winter months. In the northern Pacific coast states the difference between summer and winter rainfall is much more pronounced than in the northern portion.
