By Maj. A. H. Thiessen  
Science Service Meteorologist

Mountain climate! Who is not thrilled at the prospect of a vacation in the mountains? There is a reason. The pure, invigorating mountain air is due to the greatly decreased number of dust particles, which are very numerous at low levels. Then, due both to less dust and less water vapor, the air is highly transparent to the sun's radiation. While the days may be warm, the evenings and nights are delightfully fresh and cool, because of the very rapid outgoing radiation through the almost dustless, dry air. Also, snow is often found at moderate altitudes, especially in early summer.
