

For Release By Major A. H. Thiessen
July 25, 1938 Science Service Meteorologist

Air pressure and fishing! Who knows what kind of weather induces fish to rise to the bait? One fisherman believes one thing, and another has a different view. It is no doubt a vexing question depending upon many factors. Do fish rise best when it is cloudy, raining, or windy; or when it is fair and calm? The point is that heavy baskets have been made under all conditions - and also empty ones. One observer believes that air pressure is the key, and that fish bite best right after a storm; that is, when the pressure is rising.
