By Major A. H. Thiessen
Science Service Meteorologist

Water in the air! If the air, or the space above us to the top of the atmosphere, were saturated with water vapor, how much would it amount to if it all fell as rain? Only about one inch! But we frequently have rains of over one inch — where does the water come from? The fact is that the forming of clouds and rain is a continuing process. Moist air rises and cools, condenses and falls as rain, followed by more and more moist air. The rain keeps on falling until the condition changes, which is brought about often by a change in wind direction. -----
