

For Release
Sept. 19, 1938

By Major A. H. Thiessen
Science Service Meteorologist

Lightning and meteors! Most people have a wholesome respect for lightning and do not unnecessarily expose themselves. The chance of meeting death by lightning is very small, one to half a million in a year. This ratio varies in different parts of the earth according to thunderstorm frequency. Meteors, the shooting stars of the sky, are generally consumed in their terrific rush through the atmosphere, but some are so large that they are not entirely consumed and reach the earth. They may therefore conceivably cause death. But it has been calculated that in this country only one person will be hit in about 10,000 years.
