Sept. 24, 1938

By Major A. H. Thiessen
Science Service Meteorologist

Weather and life! The weather on our world is just about right for sustaining life. Life needs air, moisture, light and heat. If the earth were much smaller it would lose its atmosphere; if cooler, an ice age would come again; if hotter, disastrous results would obviously follow. Life depends upon a nice balance of at least these few essentials any one of which, if lacking to any considerable degree, would make life impossible. No other planet seems to have this nice balance of conditions suitable for life as we know it here.
