Sept. 27, 1938

By Major A. H. Thiessen
Science Service Meteorologist

Weather and crops! What makes a good season for growing crops? It is a fair mixture of sunlight, warmth, and moisture in the air and in the ground, each distributed over a sufficient length of time to mature the crop. We often hear complaints of how a certain storm, a certain lack of rainfall, or a drying wind caused the loss of so many millions of dollars to the crops of the country. But it is heartening to have also the other side of the story of how in spite of certain vicissitudes of weather the season as a whole brought forth good crops.
