Science Service Meteorologist

Work of the wind! In this connection we think generally of the wind propelling sailboats or driving windmills. Other interesting functions are those which have to do with plant life. It is thought that before the time of insects all plants depended upon the wind for pollination. But while insects do effect pollination now, and have done so ever since their coming, many plants are still wind-pollinated. Wind is also, as everyone knows, a great carrier of seeds, and the seeds of many plants are specially adapted to be borne long distances by the wind.
