By Maj. A. H. Thiessen
Science Service Meteorologist

As others see us! How would our world appear to someone out in space, say from the moon, with the sun shining full upon us? There would be dazzling white cloud masses at the equatorial belt of cloudiness and rains. These would move north and south a little with the seasons. There would also be large patches of cloudiness ever progressing from west to east in the temperate latitudes, indicating the eastward movement of cyclones. Then there would be darker areas of the earth's surface itself, indicating the temporarily fair weather regions between the storms, and also the dark of the almost perennially fair weather of the desert areas.
