Science Service Meteorologist

Daily temperature ranges! Our comfort or discomfort and consequently our activities depend in a large measure on the daily changes in temperatures. The greatest daily ranges occur in early summer, while the least occur in early winter. This is largely due to sun control. In early summer the sun is high and the sunshine hours long; and at night there is a rapid radiation of the accumulated heat. During early winter, the reverse conditions prevail: low sun, and less hours of sunshine. Furthermore, there is less cloudiness in summer than in winter, thus conducing to more rapid radiation at night in summer, and hence greater temperature ranges.
