By Maj. A. H. Thiessen
Science Service Meteorologist

The moon and its weather! The Man in the Moon has no atmosphere to breathe. Since changes in the weather, as we know them, are largely manifestations of the atmosphere, what kind of weather does he have anyway? He sees a black sky with stars day and night, and the sun rises and sets for him every 29 1/2 of our days. He would see our earth going through all the phases, as we see the moon. He would suffer from ultraviolet light and meteors, which our atmosphere strains out for us. All his days and nights would be clear, with shifts in temperatures in the native rock of about 400 degrees with every change from day to night.
