Science Service Meteorologist

Baseball! Training for this great game has already started. The camps of both United States and Canadian teams are located in South Carolina, Florida, Louisiana, Texas and California. The selection of the camps is largely a matter of suitable temperatures. Averages range at these places in March from 55 to 63 degrees. The April temperatures approach those of summer in the large cities like New York, Chicago and Montreal. Temperature affects the ball as well as the players. It is known that a batted ball travels farther on chilly than on warm days. Air resistance decreases with lower temperatures. -----
