Science Service Meteorologist

Future weather! It seems that old Mother Earth has cooled down from an original gaseous state to a condition in which it radiates as much as it receives from the sun. This means that the weather and climate within limits will remain as they are until changed by outside conditions. These changing conditions are mostly solar. The sun, it is believed, after a million million years will have lost six per cent of its weight by radiation, and its radiating power will have been so reduced that the earth temperature will be about 50 degrees lower than at present. So, barring accidents, we are at the dawn of an almost endless day.
