By Maj. A. H. Thiessen
Science Service Meteorologist

Long range weather forecasts! These can not be said to be a great success to date. It is interesting to note the opinion of a great meteorologist of 40 years ago, when there was as great a demand for them as now. He said that we should not expect the detail which is put into the daily forecasts, and should be satisfied with a statement as to the general features only of a week, month or season. He urged that we should study the basis of meteorological phenomena, the laws of mechanics and heat that apply to the air, and he implied (since the science did not start until 1830) that we should be obliged to wait some time and that the true basis is one founded on facts and laws laboriously discovered after a long search.
