By Maj. A. H. Thiessen  
Science Service Meteorologist

Boating weather! Summer days are boating days, but whether one uses a speedboat or a hand-powered canoe, one should be weather-detective enough so as not to be caught out in a thunderstorm as it is very difficult to foresee the extent of their severity. There is usually at first a light wind which dying down springs up from the south or west across the path of the storm. It soon changes and blows right into the storm, then rain commences and the wind treacherously changes its direction, again blowing away from the storm in gusts, called the squall wind. This last direction is, of course, the direction the storm is traveling.
