Science Service Meteorologist

Cumulus Clouds! There seems to be nothing more peaceful than these superb, billowy masses of cloud so conspicuous at this time of the year. While their shapes do indicate internal commotion, it is when they develop into thunder clouds that they are at their worst. One balloonist was drawn up into such a cloud; he thought that the coolness would condense the gas and let him down; but no, the internal winds took charge, and he was raised, lowered and tossed about violently 8 or 10 times before he was tossed one side and descended to the ground in safety. But while in the cloud neither throwing out ballast or letting out gas had any effect on the control of the balloon.
