Science Service Meteorologist

Cyclones! If all the facts regarding the formation, development and decay of cyclones (revolving storms) were known, and suitable and enough observations regarding them could be obtained, perhaps more accurate forecasts of the weather might be made. The latest conception of a cyclone was supplied by the Norwegian school of meteorologists. It teaches, in general, that as warm air flows north alongside of cold air flowing south, irregularities are set up which develop into cyclones. The cold air underruns the warm air in one part of the formation, and in another part the warm overruns the cold. In either case air is raised, cooled and rain may fall.
