By Major A.H. Thiessen
Science Service Meteorologist

Meteorology and defense! A knowledge of our various climates and the many and varied vicissitudes of American weather is a great help in problems of national defense. Consideration of the weather and climatic elements enter very largely into the activities of many industries, and in no less degree do they affect the problems of the army. For instance, to know the climates is to know where to place military training centers, because these must be where the climate is most suitable for the particular training to be carried on. Weather also affects all branches of the army to some extent, and some branches are entirely dependent upon suitable weather to conduct their work most efficiently.
