By Major A.H. Thiessen
Science Service Meteorologist

Air and sea temperatures! Sometimes when sailors jump overboard for a swim, they find the sea water colder than the air, and at other times warmer. In the Atlantic Ocean, north of the tropics, in the winter months, the sea is warmer than the air, and this is most pronounced in the waters east of the continent, the greatest difference being about 8 degrees. In the summer months, however, the reverse is generally true, the sea being colder than the air; but the differences are not so large the greatest being only about 3 degrees in places adjacent to Newfoundland, east of the British Isles, and northwest of Africa.
