

For release By Major A.H. Thiessen
Jan. 3, 1940 Science Service Meteorologist

January weather! January temperatures are the most variable; that is, the average temperature of any day of this month is apt to either exceed or be less than that of the preceding day by amounts greater than in any other month. This is because the influences which bring about temperature changes are most intense in January. Cold waves, for instance, bring about greater temperature changes in winter than do warm waves in summer, because of the greater contrast in temperature between the tropical and polar regions.
