Medicine for skeptics! Six centuries ago even the learned believed in what would today be called superstition; and it is very difficult for us today to understand the weather theories of that ancient day even though we have right in our midst people who believe in astrology. Many in the 14th century believed in the influence of the planets and the moon upon the weather, and works were written on the subject which today are quite unintelligible. The supposed influence of the planets or the moon on the weather may be investigated scientifically if the research is guided by a competent scholar. This is most excellent medicine for skeptics.
