Day and night winds! If one takes a sail in the afternoon, it is often wise to make port before the sun goes down. This is because it is windier during the sunshine hours than in darkness, excepting of course on days with cyclonic storms. As soon as the sun comes up, surface heating begins, the lower layer of air gets warmer and convection currents are set up. The wind blows stronger as the heating action continues, but dies down as the evening approaches. Windy days are often preceded or succeeded by calm nights.
