

For release By Major A.H. Thiessen
June 5, 1940 Science Service Meteorologist

Heavy air! Now that summer has come people will say, on some days, that the air is "heavy." Those days will be hot with high humidity which may be from 85% to 95%. The air will indeed have a heavy effect on our feelings, which are depressed due to heat, moisture in the air and lack of wind. As a matter of fact, the air is not really heavy in a physical sense on those days, but lighter than usual, as a cubic foot of water vapor is much lighter than a cubic foot of air. On a dry, cold winter day, the air is really relatively heavy; but we feel great exhilaration and consequently think the air is then light.
