Climatic changes! That climate does change has long been known, and concerning the reasons there has been much speculation. No matter what causes are given, they must explain the now well-known facts regarding the changes. Some of these are: The ice ages, of which there were several, affected the whole world, were of unequal intensity and duration, and of irregular occurrence. We are now living in the last stages of the last one. Between these great ice ages were minor ones, transitions from warm to cold and from cold to warm, which is to say that the great general advances and retreats of the ice sheets were marked by minor advances and retreats. We seem to be now returning to a milder condition, although this will probably be marked by cold and warm periods.
