

For release  
Jan. 2, 1941

By Major A.H. Thiessen  
Science Service Meteorologist

Two forecasters! The official forecaster who predicts the outside weather has a problem akin to the air-conditioning engineer who endeavors to specify what the weather inside should be and then tries to install appropriate apparatus to bring about the result required. Both forecasters must satisfy a critical public. Both do extremely satisfactory work. Both save industry much money, and both have the great satisfaction of knowing that through their work the country's industries become more and more efficient, for there is scarcely a human activity that is not affected by the weather. Indeed, for some industries simply comfortable weather is not enough, the air must have a certain amount of humidity, a certain degree of temperature, and be adequately circulated.
