By Major A.H. Thiessen
Science Service Meteorologist

Weather and war! Battle plans are made days and weeks ahead, and since the efficiency of all branches, especially the mechanized units and aviation, depends greatly upon the weather, a correct forecast is a decided advantage. To further strengthen the U.S. Army and Navy in weather forecasting, selected men from both services are now taking stiff courses in all branches of weather science. Since the High Command authorities realize the value of long-range forecasting, this is receiving considerable attention. The men now under training will later become the teachers of the military personnel at army posts. Thus meteorology will be applied to military art for the protection of our citizens and institutions.
