By Major A.H. Thiessen
Science Service Meteorologist

Icebergs! Sir John Franklin, the famous Arctic explorer, saw an iceberg in the making. Attracted by a loud report caused by the big chunk of ice breaking away, he saw it fall into the sea and then wholly disappear, causing a violent boiling and shooting of clouds of spray. He immediately pointed his boat out to sea to avoid the huge rollers, which were considerable even four miles away where his ship was located. The berg rose, sticking its top 100 feet out of water; it rolled about trying to find a stable position, and finally rolled over and then rocked about for some minutes, this time with its head only 60 feet out of water. The estimated weight was 420,000 tons.
