By Major A.H. Thiessen
Science Service Meteorologist

Forestry and weather! Since most of the forests of America have been depleted, we must depend upon trained foresters for planting new ones. To do their work most successfully, they are greatly dependent upon weather data because they are as much interested as farmers in getting the most out of an acre. Foresters must know the many climatic factors affecting plant growth, which are determined and obtained by the foresters and meteorologists working together. These factors are the many combinations of temperature, wind, humidity and sunshine that affect trees during all periods of their growth.
